

NOTES:

STEP 1. All parts of the connector are shown. A compression tool is necessary to complete the connection.

STEP 2. Strip the cable inner conductor, dielectric, braid, and jacket as shown using Corex II or equivalent strip tool.

STEP 3. Insert the center conductor and dielectric with foil into the center diameter of connector. Push connector onto the cable while rotating the connector 1/2 a turn. No braid should be visible behind the connector. Check for proper insertion depth in the braid depth window.

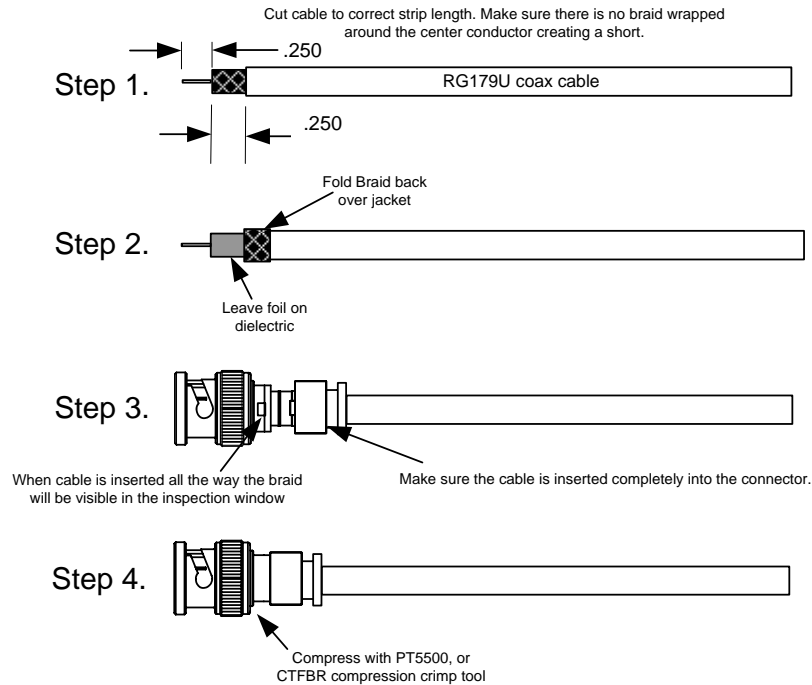

STEP 4. Continuity test cable before crimping to ensure a good connection.

STEP 5. Compress connector where shown using tool(s) listed or any other equivalent compression tool.

* When using with Taperwire 3GIG products, peel back & cut off 2" of the pink peel-off liner. Release the coax by breaking the adhesive by gently running a screwdriver or blade down both sides of the conductors. Be careful not to cut through the clear or white backing material. Peel tape away from the conductors & trim off even with the peel-off layer. Proceed to Step 1.
